CLIMATE CHANGE POLICY

Regis Resources ("Regis") is committed to managing climate change risks. This Climate Change Policy aligns with Australia's Net Zero ambitions and reflects Regis' commitment to sustainable and responsible mining practices.

Our Commitment
Regis believes that responsible resource development can coexist with environmental and climate stewardship. Regis acknowledges the significant challenge posed by climate change and is committed to contributing to the global effort to achieve net-zero greenhouse gas emissions by 2050. As part of this commitment, Regis evaluates its operations and growth initiatives to ensure that, where appropriate and feasible, emissions reduction initiatives and decarbonisation strategies are integrated into planning and decision-making processes.

Regis recognises the importance of ensuring the sustainability of our operations. While the primary focus is efficient resource extraction, Regis will explore and implement cost-effective decarbonisation initiatives, including assessing investment in technologies and practices that reduce the Company's carbon intensity and enhance energy efficiency all the while assessing these options against remaining mine life.

Engagement
Regis believes that addressing climate change requires collaboration with stakeholders, including local communities, industry partners and government bodies. Regis is committed to developing partnerships that promotes sustainable practices and contributes to climate change resilience.

Reporting and Transparency
Regis is committed to transparency and to that end will publicly report its greenhouse gas emissions, emission reduction strategies, achievements, and climate-related initiatives in its annual Sustainability Report. As part of its disclosure, Regis will report on climate-related metrics, such as energy produced, energy consumed, renewable energy percentages, Scope 1 and Scope 2 emissions and will progress toward reporting Scope 3 emissions.

As part of Regis' public reporting requirements, Regis will align with mandatory climate-related disclosure requirements as they relate to governance, strategy, risk management, and metrics and targets.
